IDAPA 58.01.08.542.07
Separation of Potable, Non-Potable, and Raw Water Pipelines

07. Separation of Potable, Non-Potable, and Raw Water Pipelines. The requirements for the protection of potable mains from contamination by non-potable pipelines are described in Subsections 542.07.a. through 542.07.c. For the purposes of Subsection 542.07, the term "pipeline" applies to both mains and services. The Department will use the Memorandum of Understanding with the Plumbing Bureau as guidance in determining the relative responsibilities for reviewing service lines. The conditions of Subsections 542.07.a. and 542.07.b. shall apply to all potable services constructed or reconstructed after April 15, 2007 and where the Department or the QLPE is the reviewing authority. Raw water pipelines must be protected from contamination from non-potable pipelines, and must not contaminate potable pipelines. They shall therefore meet equivalent separation distances shown below from either potable or non-potable pipelines. (4-4-13)

a. Parallel installation requirements. (5-8-09)

i. Potable mains in relation to non-potable mains. (5-8-09)

(1) Greater than ten (10) feet separation: no additional requirements. (4-4-13)

(2) Ten (10) feet to six (6) feet separation: separate trenches, with the bottom of the potable main above the top of the non-potable main, and non-potable main constructed with potable water class pipe. (4-4-13)

(3) Less than six (6) feet separation: design engineer to submit data to the Department for review and approval showing that this installation will protect public health and the environment, non-potable main to be constructed of potable water class pipe, and with the bottom of the potable main above the top of the non-potable main. (4-4-13)

(4) Non-potable mains are prohibited from being located in the same trench as potable mains. (3-30-07)

(5) Pressure wastewater mains or other pressurized mains or lines containing non-potable fluids shall be no closer horizontally than ten (10) feet from potable mains. (4-7-11)

ii. New potable services in relation to non-potable services, new potable services in relation to non-potable mains, and new non-potable services in relation to potable mains. (5-8-09)

(1) Greater than six (6) feet separation: no additional requirements based on separation distance. (5-8-09)

(2) Less than six (6) feet separation: design engineer to submit data that this installation will protect public health and the environment and non-potable service constructed with potable water class pipe. (5-8-09)

(3) New potable services are prohibited from being located in the same trench as non-potable mains or non-potable services. (5-8-09)

b. Requirements for potable water mains or services crossing non-potable water mains or services. (4-4-13)

i. If there is eighteen (18) inches or more vertical separation with the potable water pipeline above the non-potable pipeline, then the potable pipeline joints must be as far as possible from the non-potable water pipeline. (4-7-11)

ii. If there is eighteen (18) inches or more vertical separation with the potable water pipeline below the non-potable pipeline, then the potable pipeline joints must be as far as possible from the non-potable pipeline, and the non-potable pipeline must be supported through the crossing to prevent settling. (4-7-11)

iii. Less than eighteen (18) inches vertical separation: (5-8-09)

(1) Potable pipeline joint to be as far as possible from the non-potable pipeline; and either: (5-8-09)

(a) Non-potable pipeline constructed with potable water class pipe for a minimum of ten (10) feet either side of potable pipeline with a single twenty (20) foot section of potable water class pipe centered on the crossing; or (5-8-09)

(b) Sleeve non-potable or potable pipeline with potable water class pipe for ten (10) feet either side of crossing. Use of hydraulic cementitious materials such as concrete, controlled density fill, and concrete slurry encasement is not allowed as a substitute for sleeving. (5-8-09)

(2) If potable pipeline is below non-potable pipeline, the non-potable pipeline must also be supported through the crossing to prevent settling. (5-8-09)

iv. Pressure wastewater mains or other pressurized mains or lines containing non-potable fluids shall be no closer vertically than eighteen (18) inches from potable mains. (4-7-11)

c. Existing potable services in relation to new non-potable mains, existing non-potable services in relation to new potable mains, and existing potable services in relation to new non-potable services shall meet the requirements of Subsection 542.07.b., where practical, based on cost, construction factors, and public health significance. If the Department determines that there are significant health concerns with these services, such as where a large existing service serves an apartment building or a shopping center, then the design shall conform with Subsection 542.07.b. (5-8-09)

(q) Vibrators shall be used in structures to assure adequate consolidation around pipes and reinforcing steel. Vibrators shall transmit vibrations to the concrete at frequencies of not less than five thousand (5,000) impulses per minute. Vibrators shall be manipulated so as to work the concrete thoroughly around the reinforcement, imbedded fixtures and into corners and angles of the forms. Vibrators shall not be used in lieu of placing as a means to cause the concrete to flow or run into position. The vibration at any point shall be of sufficient duration to accomplish thorough consolidation, but shall not be prolonged to the point where segregation of aggregate occurs.
(r) If the air temperature falls below forty degrees Fahrenheit (40° F) the following cold weather placement procedures shall apply: 1) No concrete shall be placed on frozen subgrade or gravel leveling course nor shall there be any ice, snow, or frost on the concrete forms; 2) The Contractor shall furnish concrete that has a temperature at the time of placement, of at least fifty degrees Fahrenheit (50°F) and not more than eighty degrees Fahrenheit (80°F); 3) Heating equipment shall heat the materials uniformly; 4) Heating shall be done in such a manner that occurrence of non-uniform moisture contents or contamination in the aggregate shall not occur; 5) The aggregate shall not contain frozen lumps, ice or snow; 6) Aggregate shall not be heated to temperatures in excess of one hundred fifty degrees Fahrenheit (150° F); 7) The aggregate and water mixture shall have a temperature below eighty degrees Fahrenheit (80° F) before any cement or air entraining agent is added; 8) The concrete shall be protected from frost, snow or freezing for a period of seven (7) days at a minimum concrete temperature of forty degrees Fahrenheit (40°F).

If, in the judgment of the Engineer, rock pockets are of such extent or character as to materially affect the strength of the structure or to endanger the life of the steel reinforcement, he may declare the concrete defective and require the removal and replacement of that portion of the structure affected. All holes and depressions shall be cleaned, thoroughly wetted, and filled with a cement mortar composed of one part of cement to two parts of sand. All fins caused by form joints and other projections shall be removed above the ground line. The resulting surfaces shall be reasonably smooth and uniform in texture and color. All surfaces which cannot be finished to the satisfaction of the Engineer shall be given an approved rubbed surface finish or the structure shall be removed.
(t) Membrane forming curing compound shall not be applied to concrete surfaces before the finishing has been acceptably completed. The curing compound shall be uniformly applied at the rate of one (1) gallon to not more than two hundred (200) square feet of surface. PREFABRICATED VARIABLE SPEED PUMP STATION SPECS. & REQUIREMENTS:

Design Data:

Total Shares in Station = 13.4 NSCC
*13.4 Shares/50 Miner's Inches*0.625 Miner's Inch/Share = 0.1675 CFS = 75.17 GPM*

Pump Station Criteria:

120 GPM Discharge at 180' TDH
Pump Filter and Clemons Self-Cleaning Screens Required
Main Line Tie In Check Valves Required
Flow Meter w/ Totalizer Required
Meter Base and Main Electrical Disconnect
Variable Frequency Drive on Motor
PLC Programmer in Lockable Control Panel
477V – 3 Phase Power – Availability to be Verified.

Qualifications:

The VFD pump control system shall be manufactured and installed by trained and certified technicians.

The pump station manufacturer shall employ certified service technicians that are trained in service on the pump station, including the VFD/PLC control system.

Pump Control System:

The UL listed control panel shall include variable frequency drives inverters (VFD), and programmable logic controllers (PLC).

The VFD pump control panel shall be manufactured and listed by a UL508 Panel Shop The panel shall be UL labeled as an "Enclosed Industrial Control Panel". The pump control panel shall be completely manufactured, tested and programmed prior to delivery to the job site. A wiring schematic and pump(s) nameplate information shall be permanently affixed to the inside of the control enclosure.

The VFD and associate electrical equipment shall be mounted in a UL Type 3R enclosure for outdoor installation. The cooling system shall prevent the VFD from reaching high ambient temperatures, which will cause temperature faults or warnings. The cooling system shall not allow dust and/or dirt inside the pump control panel.

Variable Frequency Drives (VFD):

The VFDs shall be appropriately sized to meet the FLA, full load amps, required by the pump motor as stated on the motor nameplate.

Pressure Transducer:

A stainless steel pressure transducer shall continually monitor system pressure. A 4–20 mA or 1–10v signal shall be transmitted to the VFD – the VFD shall react according to pre–programmed criteria.

Programmable Logic Controller (PLC):

The control panel door shall include a PLC with a digital operator interface. The operator interface shall have an alpha/numeric display with a minimum of 64 characters. The operator interface shall allow the used to make adjustment to the PLC program locally, without requiring any additional equipment, such as a laptop computer. The VFD control keypad is not an acceptable substitution for the digital operator interface.

The PLC shall be fully programmed prior to pump panel installation.

The PLC and operator interface shall provide (at a minimum) the flowing functions:
**Display run status of all pumps*
**Display systems pressure with password protected set point control*
**Display any fault condition and log fault with time and date stamp*
**Display motor run hours–User re–settable*
**Pre–programmed start–up routines for initial start–up, mainline fill, power outages, and re–start after a system fault*
**Allow user to adjust operating variables and timing functions such as low pressure, high pressure, low water, start–up pressure and ramp time, and restart delays*
**VFD bypass routine to allow emergency pressure differential operation of pumps if the VFD fails–User selectable*
**Control of automatic valve supplying intake screen system*
**Display of options such as flow and total flow*

Disconnect Switch:

A circuit breaker disconnect switch shall be integrated into the pump control panel and shall be the disconnect means for the equipment.

Overcurrent Protection:

The VFD bridge rectifiers shall be protected from over current by appropriately sized circuit breakers.

Thermal Overload:

In case of VFD failure, the pump control panel shall include a magnetic starter, which consists of a contactor, circuit breaker, and thermal overload, so that the motor may be operated across–the–line manually until the VFD is repaired or replaced.

Voltage and Phase Monitoring

The Pump Control Panel shall monitor incoming power and automatically disconnection power if it does not meet specified criteria. A magnetic contactor disconnect to the VFD shall be required. The system shall have an automatic re–start routine when the power returns to normal.

Lighting and Surge Protection:

The Pump Control Panel shall be equipped with transient voltage and surge arrestors.

Pre-programmed Start-up Routines:

The PLC shall be programmed with various start–up routines that limit and/or delay, the starting, and acceleration of the pump to ensure that excessive velocity and pressure do not damage and distribution system. The program shall include individual routines for initial start–up, mainline fill, re–start after a power outage, and re–start after a system fault. The operator shall be able to adjust the timing of the routines via the operator interface.

High Discharge Pressure Switch:

(6) When directed by the City of Jerome, asphalt products shall be treated with a heat-stable anti-stripping additive of not less that 0.5 percent by weight.

(7) The asphalt mix shall be laid only when the ambient air temperature is greater than 55 degrees Fahrenheit and rising and the mix is a temperature of 235 degrees Fahrenheit or greater.

(8) Paving may be allowed at lower ambient air temperatures (45 degrees F and rising) with special permission of the City Engineer and under the following conditions:
(a) Testing: Testing and inspection frequency shall double.
(b) Ground Surface Temperature shall exceed 45 degrees Fahrenheit.

(9) After spreading, the mixture shall be thoroughly and uniformly compacted with power rollers as directed by the City. Rolling of the mix shall begin as soon after spreading as it will bear the roller without undue displacement or hairline cracking. Initial rolling shall be done longitudinally. The rollers shall overlap on successive trips. Alternate trips of the roller shall be slightly different lengths. Unless otherwise directed, the initial or breakdown rolling shall consist of one complete coverage of the paving mixture performed with a two-axle tandem roller. Initial breakdown rolling shall be followed by three complete coverages with a pneumatic-tired roller while the temperature of the mixture is at or above 140 degrees Fahrenheit. The final rolling shall be performed in such a manner that cracking, shoving, or displacement shall be avoided. Final rolling shall be completed the same day the pavement is placed. Sufficient rollers shall be furnished to handle the output from the plant. Rolling shall continue until all rolling marks are eliminated and the surface is of uniform texture and true to grade and cross-section.

(10) To prevent adhesion of the mixture to the rollers, the wheels shall be kept properly moistened with water or water mixed with very small quantities of detergent or other approved material. Excessive water will not be permitted on the roller surfaces. Diesel fuel, kerosene, or other solvents shall not be applied to roller drums of wheels.

The final matt thickness after compaction shall be no less than the thickness depicted on these plans.

The completed hot-mix asphalt surface course shall have a field density equal to or greater than 92 percent for sections paved with Superpave SP-2 or SP-3 mix designs. In street sections, when utilizing a corrected nuclear densometer in the backscatter mode, the allowable tolerance ranges shall be in accordance with WAQTC TM-8 in place density of hot-mix asphalt.

The final surface shall be of a uniform texture and shall conform to the line and grade shown on the plans. Before final acceptance of the project or during the progress of the work, the thickness of all courses will be determined by the City of Jerome's representative.

All unsatisfactory work shall be repaired, replaced, or corrected at the Contractor's expense. The method of correcting unsatisfactory work shall be approved by the City of Jerome prior to correction.

Both density and thickness shall be carefully controlled during construction and shall be in full compliance with plans and specifications. For the purposes of testing the surface on all courses, one 10-foot straightened edge shall be used. The straightedge shall be held in successive positions parallel and perpendicular to the street centerline in contact with the surface, and the entire areas checked from one side to the other. Advances along the pavement shall be in successive stages of not more than half the length of the straightedge.

Irregularities which may develop before the completion of rolling shall be remedied by loosening the surface mix and removing or adding materials as may be required. Any irregularities or defects which are found after final rolling, which vary more than 0.02 of a foot in 10 feet for surface courses shall be corrected at the Contractor's expense. All minor surface projections, joints, and minor honey-combed surfaces shall be iron smooth to grade, as may be directed by the City of Jerome.

CONCRETE

This section shall apply to all concrete placed within the City rights of way for the construction of or in conjunction with curb and gutter, valley gutter, sidewalks, approved curb cuts, sanitary sewers, storm sewers, concrete slabs, concrete structures and footings. Portland cement concrete shall be composed of Portland cement, fine aggregate, coarse aggregate and water, proportioned and mixed in accordance with these specifications and placed in reasonably close conformity with the lines and grades shown on the plans.

Materials

(1) Concrete shall be ready-mix concrete and shall conform to ASTM designation C-94-92 Standard Specifications The maximum size aggregate shall be as shown. References to "Purchaser" in the ASTM C-94-92 Specifications shall mean the Engineer and references to "User" shall mean Contractor.
(2) The following conditions shall be in lieu of or in addition to the requirements of ASTM C-94-92 Specifications:
a) Truck mixers shall be equipped with electrically actuated counters by which the number of revolutions of the drum or blades may be readily verified. The counters shall be actuated at the time of starting the mixer.
b) No additional mixing water will be added to obtain the specified slump without permission of the City Engineer.
c) Cement may be added to the mix prior to pouring with adequate mixing.
(3) Concrete curing compound shall be a liquid membrane forming colored compound conforming to AASHTO designation M 148-82 or approved equal.
(4) Preformed expansion material shall be one-half (½) inch thick and shall conform to AASHTO designation M-33.
(5) Preformed reinforcing bar shall conform to ASTM A-305, A-615, 616 and 617.

Workmanship

In addition to ISPWC Standards these specifications shall apply with the addition of the following:
(a) The work shall consist of removal of any obstructions which are in the area of construction.
(b) The contractor shall make all arrangements for disposal of existing materials to be removed. All surplus embankment, concrete and masonry materials shall be disposed of at a location approved by the Engineer.
(c) The Contractor shall dispose of all decomposable or burnable materials and all fencing, metal pipe, and all other debris associated with the project at an approved landfill.
(d) The root system of bushes shall be removed to a depth of one (1) foot below subgrade. Complete removal and disposal of trees and stumps and the removal of their top roots to a depth of one (1) foot below subgrade level and backfill of any hole or depression is required.
(e) The work shall include excavation and disposal of earth or other materials within the area of construction, maintenance of adequate drainage during construction, and supplying, hauling, placing and compacting approved embankment material.
(f) Natural ground, or compacted fill material upon which the concrete is to be placed, shall be firm, free of organic matter, and completely free of frost. The ground shall be graded to neat lines and grades.
(g) The subgrade shall be free from ruts, corrugations, segregated material or other irregularities. The finished surface shall not vary more than one-half (1/2) inch from a ten (10) foot straight edge when applied to the surface parallel with and at right angles to the centerline. The moisture content of the subgrade material shall be the optimum moisture content and the material shall be uniformly compacted to at least ninety-five percent (95%) of its maximum density as determined by AASHTO T-99-90 for a depth of six (6) inches.
(h) Forms shall be timber or metal. They shall be straight, clean and free from warp. Lumber used for forms shall be dressed to a uniform thickness and shall be free from loose knots and other defects.
(i) Forms used on surfaces exposed to public view shall be constructed and maintained in such a manner that ordinary surface finishing will provide a smooth surface with a uniform color and texture. No patches or repairs to forms or in the case of metal forms, no dents will be permitted that will leave protrusions or indentations in the finished concrete.
(j) Forms shall be mortar tight and of sufficient rigidity to prevent distortion due to the pressure of the concrete, vibration and loads incident to the construction operations.
(k) Forms shall be treated to prevent the adherence of concrete. Material used for treating shall not adhere to or discolor the concrete.
(l) Metal ties or anchorages within the forms shall be constructed so as to permit their removal to a depth of at least one-half (1/2) inch from the face of the concrete upon removal of the forms.
(m) Concrete shall not be placed until the forms have been checked and approved by the Engineer. The forms shall be clear of all debris, ice or frost before concrete is placed.
(n) Forms shall be thoroughly wetted or oiled and the base material to be poured upon shall be thoroughly dampened.
(o) Concrete shall be handled from the transporting vehicle to the place of final deposit as rapidly as practicable by methods which shall prevent the segregation of the materials and the displacement of reinforcing steel.
(p) Concrete, during and immediately after depositing, shall be tamped into place and thoroughly compacted, until decrease in volume is no longer apparent and all air has been removed, but shall not continue to the extent that localized areas of grout are formed.
(q) Vibrators shall be used in structures to assure adequate consolidation around pipes and reinforcing steel. Vibrators shall transmit vibrations to the concrete at frequencies of not less than five thousand (5,000) impulses per minute. Vibrators shall be manipulated so as to work the concrete thoroughly around the reinforcement, imbedded fixtures and into corners and angles of the forms. Vibrators shall not be used in lieu of placing as a means to cause the concrete to flow or run into position. The vibration at any point shall be of sufficient duration to accomplish thorough consolidation, but shall not be prolonged to the point where segregation of aggregate occurs.
(r) If the air temperature falls below forty degrees Fahrenheit (40° F) the following cold weather placement procedures shall apply: 1) No concrete shall be placed on frozen subgrade or gravel leveling course nor shall there be any ice, snow, or frost on the concrete forms; 2) The Contractor shall furnish concrete that has a temperature at the time of placement, of at least fifty degrees Fahrenheit (50°F) and not more than eighty degrees Fahrenheit (80°F); 3) Heating equipment shall heat the materials uniformly; 4) Heating shall be done in such a manner that occurrence of non-uniform moisture contents or contamination in the aggregate shall not occur; 5) The aggregate shall not contain frozen lumps, ice or snow; 6) Aggregate shall not be heated to temperatures in excess of one hundred fifty degrees Fahrenheit (150° F); 7) The aggregate and water mixture shall have a temperature below eighty degrees Fahrenheit (80° F) before any cement or air entraining agent is added; 8) The concrete shall be protected from cost, snow or freezing for a period of seven (7) days at a minimum concrete temperature of forty degrees Fahrenheit (40°F).
(s) An ordinary surface finish shall be applied to all concrete surfaces. Immediately after the forms have been removed, the Contractor shall remove form bolts and tie wires. If, in the judgment of the Engineer, rock pockets are of such extent or character as to materially affect the strength of the structure or to endanger the life of the steel reinforcement, he may declare the concrete defective and require the removal and replacement of that portion of the structure affected. All holes and depressions shall be cleaned, thoroughly wetted, and filled with a cement mortar composed of one part of cement to two parts of sand. All fins caused by form joints and other projections shall be removed above the ground line. The resulting surfaces shall be reasonably smooth and uniform in texture and color. All surfaces which cannot be finished to the satisfaction of the Engineer shall be given an approved rubbed surface finish or the structure shall be removed.
(t) Membrane forming curing compound shall not be applied to concrete surfaces before the finishing has been acceptably completed. The curing compound shall be uniformly applied at the rate of one (1) gallon to not more than two hundred (200) square feet of surface. The curing compound shall be thoroughly mixed with the pigment uniformly distributed throughout. The curing compound shall not be applied during rainfall unless the surface is immediately covered in an approved manner. No Curing compound shall be required during cold weather if the cement is covered with blankets. If heat is required during cold weather curing compound shall be used. Should the film become scuffed or damaged from any cause during the curing period, the damaged area shall be recoated immediately with additional curing compound.
(u) Curing of formed concrete structures shall be accomplished by leaving the forms in place for a minimum of twelve (12) hours. Immediately after removal of forms a curing compound shall be applied to all exposed surfaces.
(v) Curing of unformed or exposed concrete surfaces shall be accomplished by keeping the surface completely and continuously moist until curing compound is applied.
(w) The Contractor shall be responsible for the protection and repair of fresh concrete against footprints, tracks or any other objectionable marks.
(x) The Contractor shall trowel all contraction joints to one-fourth (1/4) the concrete depth unless otherwise instructed by the Engineer. All felt expansion material shall be placed in such a manner as to entirely separate the adjacent slabs.
(y) There shall be no vibrator rolling performed within fifty (50) feet of freshly poured concrete for a period not less than forty-eight (48) hours.
(z) Traffic: Curb-gutter and driveway approach must be protected from all traffic for a period of seven (7) days after which a foot of graded gravel may be placed over the concrete and light cars and pickups may drive over the concrete. At the end of fourteen (14) days the gravel may be removed. No loaded trucks shall be allowed over the concrete until the end of twenty-eight (28) days.
(aa) All work shall conform to the Idaho Standards For Public Works Construction (ISPWC) Standard Drawings.

These specifications shall apply with the addition of the following:
(1) The contractor shall notify the Engineer to check and approve subgrade, leveling course, forms, alignment reinforcement and expansion material prior to pouring concrete.
(2) Testing shall be in accordance with the following standard methods:
a) Compressive Strength of molded concrete cylinders: AASHTO T 22-90
b) Slump of Portland Cement Concrete: AASHTO T 119-82 (with particular attention being paid to Note No. 3)

4. COORDINATE WORK SCHEDULE AND OBSERVATIONS WITH LANDSCAPE ARCHITECT PRIOR TO CONSTRUCTION START-UP.
5. ALL PLANT MATERIAL SHALL BE INSTALLED AS PER DETAILS.
6. ALL PLANT MATERIAL SHALL CONFORM TO THE AMERICAN NURSERYMAN STANDARDS FOR TYPE AND SIZE SHOWN. PLANTS WILL BE REJECTED IF NOT IN A SOUND AND HEALTHY CONDITION.
7. IN THE EVENT OF A PLANT COUNT DISCREPANCY, PLANT SYMBOLS SHALL OVERRIDE SCHEDULE QUANTITIES AND CALL OUT SYMBOL NUMBERS.
8. ALL PLANTING BEDS SHALL BE COVERED WITH A MINIMUM OF 3" DEPTH OF (1/2" MINUS) BLACK CINDER ROCK MULCH. SUBMIT SAMPLE FOR APPROVAL.

10. FINISH GRADES SHALL PROVIDE A SMOOTH TRANSITION WITH ADJACENT SURFACES AND ENSURE POSITIVE DRAINAGE IN ACCORDANCE WITH THE SITE GRADING PLAN.
11. AMEND EXISTING APPROVED TOPSOIL AT A RATIO OF THREE CUBIC YARDS OF APPROVED COMPOST PER 1000 SQUARE FEET. ROTO-TILL ORGANIC MATTER A MINIMUM OF 6 INCHES INTO TOPSOIL.
12. FERTILIZE ALL TREES AND SHRUBS WITH 'AGRIFORM' PLANTING TABLETS. QUANTITY PER MANUFACTURER'S RECOMMENDATIONS.
13. ALL PLANTING BEDS SHALL HAVE A MINIMUM 18" DEPTH OF TOPSOIL. LAWN AREAS SHALL HAVE A MINIMUM 12" DEPTH OF TOPSOIL. SPREAD, COMPACT, AND FINE GRADE TOPSOIL TO A SMOOTH AND UNIFORM GRADE 3" BELOW ADJACENT SURFACES OF PLANTER BED AREAS, 1-1/2" BELOW ADJACENT SURFACES OF TURF SOD AREAS, AND 1" BELOW ADJACENT SURFACES OF TURF SEED AREAS.
14. REUSE EXISTING TOPSOIL STOCKPILED ON THE SITE. SUPPLEMENT WITH IMPORTED TOPSOIL WHEN QUANTITIES ARE INSUFFICIENT. VERIFY SUITABILITY AND CONDITION OF TOPSOIL AS A GROWING MEDIUM. PERFORM SOIL TEST/ ANALYSIS AND PROVIDE ADDITIONAL AMENDMENT AS DETERMINED BY SOIL TESTS. TOPSOIL SHALL BE A LOOSE, FRIABLE, SANDY LOAM, CLEAN AND FREE OF TOXIC MATERIALS, NOXIOUS WEEDS, WEED SEEDS, ROCKS, GRASS OR OTHER FOREIGN MATERIAL AND A HAVE A PH OF 5.5 TO 7.0. 15. IF IMPORTED TOPSOIL FROM OFF-SITE SOURCES IS REQUIRED, ENSURE IT IS FERTILE, FRIABLE, NATURAL LOAM, SURFACE SOIL, REASONABLY FREE OF SUBSOIL, CLAY LUMPS, BRUSH, WEEDS AND OTHER LITTER, AND FREE OF ROOTS, STUMPS, STONES LARGER THAN 2 INCHES IN ANY DIMENSION, AND OTHER EXTRANEOUS OR TOXIC MATTER HARMFUL TO PLANT GROWTH.

   B) REPRESENTATIVE SAMPLES SHALL BE TESTED FOR ACIDITY, FERTILITY, TOXICITY, AND GENERAL TEXTURE BY A RECOGNIZED COMMERCIAL OR GOVERNMENT AGENCY AND COPIES OF THE TESTING AGENCY'S FINDINGS AND RECOMMENDATIONS SHALL BE FURNISHED TO THE OWNER'S REPRESENTATIVE BY THE CONTRACTOR. NO TOPSOIL SHALL BE DELIVERED IN A FROZEN OR MUDDY CONDITION. ACIDITY/ALKALINITY RANGE - PH. 5.5 TO 7.6.
16. IMMEDIATELY CLEAN UP ANY TOPSOIL OR OTHER DEBRIS ON THE SITE CREATED FROM LANDSCAPE OPERATIONS AND DISPOSE OF PROPERLY OFF SITE.
17. TREES SHALL NOT BE PLANTED WITHIN THE 10'-0" CLEAR ZONE OF ALL A.C.H.D. STORM DRAIN PIPE, STRUCTURES, OR FACILITIES. TREES SHALL NOT BE PLANTED WITHIN 5'-0" OF AN A.C.H.D. SIDEWALK.
18. ANY PERENNIAL TREES OR PLANTS THAT WILL EXTEND ROOTS DEEPER THAN 18" SHALL BE PROHIBITED OVER ACHD UNDERGROUND SEEPAGE BEDS, INFILTRATION FACILITIES OR PIPING SYSTEMS.
19. SEEPAGE BEDS AND OTHER STORM DRAINAGE FACILITIES MUST BE PROTECTED FROM ANY AND ALL CONTAMINATION DURING THE CONSTRUCTION AND INSTALLATION OF THE LANDSCAPE IRRIGATION SYSTEM.
20. IN THE EVENT OF A DISCREPANCY, NOTIFY THE DESIGN PROFESSIONAL IMMEDIATELY.

LANDSCAPE AREA PREPARATION NOTES:

1. LIMIT TURF SUBGRADE PREPARATION TO AREAS TO BE PLANTED.
2. NEWLY GRADED SUBGRADES: LOOSEN SUBGRADE TO A MINIMUM DEPTH OF 4 INCHES. REMOVE STONES LARGER THAN 1 INCH IN ANY DIMENSION AND STICKS, ROOTS, RUBBISH, AND OTHER EXTRANEOUS MATTER AND LEGALLY DISPOSE OF THEM OFF OWNER'S PROPERTY.
   A. SPREAD PLANTING SOIL TO A DEPTH OF 12 INCHES IN TURF AREAS AND 18 INCHES AT SHRUB BED AREAS BUT NOT LESS THAN REQUIRED TO MEET FINISH GRADES AFTER LIGHT ROLLING AND NATURAL SETTLEMENT. DO NOT SPREAD IF PLANTING SOIL OR SUBGRADE IS FROZEN, MUDDY, OR EXCESSIVELY WET.
   B. SPREAD PLANTING SOIL OVER LOOSENED SUBGRADE.
   C. REDUCE ELEVATION OF PLANTING SOIL TO ALLOW FOR SOIL THICKNESS OF SOD OR SEED.
3. UNCHANGED SUBGRADES: IF TURF IS TO BE PLANTED IN AREAS UNALTERED OR UNDISTURBED BY EXCAVATING, GRADING, OR SURFACE-SOIL STRIPPING OPERATIONS, PREPARE SURFACE SOIL AS FOLLOWS:
   A. REMOVE EXISTING GRASS, VEGETATION, AND TURF. DO NOT MIX INTO SURFACE SOIL.
   B. LOOSEN SURFACE SOIL TO A DEPTH OF AT LEAST 6 INCHES. PROVIDE WEED ABATEMENT PROCEDURE. APPLY SOIL AMENDMENTS AND FERTILIZERS ACCORDING TO PLANTING SOIL MIX PROPORTIONS AND MIX THOROUGHLY INTO TOP 6 INCHES OF SOIL. TILL SOIL TO A HOMOGENEOUS MIXTURE OF FINE TEXTURE.

ROLL AND RAKE, REMOVE RIDGES, AND FILL DEPRESSIONS TO MEET FINISH GRADES. LIMIT FINISH GRADING TO AREAS THAT CAN BE PLANTED IN THE IMMEDIATE FUTURE.
5. MOISTEN PREPARED AREA BEFORE PLANTING IF SOIL IS DRY. WATER THOROUGHLY AND ALLOW SURFACE TO DRY BEFORE PLANTING. DO NOT CREATE MUDDY SOIL.
6. BEFORE PLANTING, OBTAIN LANDSCAPE ARCHITECT'S ACCEPTANCE OF FINISH GRADING; RESTORE PLANTING AREAS IF ERODED OR OTHERWISE DISTURBED AFTER FINISH GRADING.

SYSTEM OPERATIONAL NOTES

SYSTEM OPERATION:
(BASED ON HISTORICAL CLIMATE)

CONTROLLER SETUP:

A CYCLING TECHNIQUE WILL BE USED FOR APPLICATION OF WATER, EACH STATION RUN TIME WILL BE APPLIED WITH THREE (3) DIFFERENT START TIMES. THEREFORE STATION RUN TIMES REFLECT ONE THIRD (1/3) THE TOTAL APPLICATION. PEAK WATER APPLICATION WILL REQUIRE IRRIGATION EVERY NIGHT. SET CONTROLLERS FOR START TIME #1 AT 1:30P.M., START TIME #2 AT 12:00A.M., AND START TIME #3 AT 5:30A.M. EXTEND WATER WINDOW IF REQUIRED TO MEET PEAK WATER REQUIREMENTS.

INITIAL STATION RUN TIMES:

SPRAY ZONES: TURF - 5 MINUTE CYCLES.
ROTOR ZONES: TURF - 15 MINUTE CYCLES.

SYSTEM BALANCING:

AS THE SYSTEM OPERATES, SOME ZONES WILL BE WET WHILE OTHERS ARE DRY. ADJUST ONLY THOSE STATIONS WHICH REQUIRE ADDITIONAL OR LESS WATER. FOR EXAMPLE, IF STATION 7S1, A 15' TURF SPRAY ZONE IS ALWAYS DRY, CHANGE THE STATION 7S1 RUN TIME FROM FIFTEEN (15) MINUTES TO SIXTEEN (16) MINUTES. CONTINUE MAKING ADJUSTMENTS UNTIL THE ZONE MOISTURE CONTENT IS ACCEPTABLE. USE NOZZLE CHANGES OR NOZZLE SCREW ADJUSTMENTS TO ADJUST WET AND DRY AREAS WITHIN A ZONE.

DISTANCE CHART

REFER TO THE FOLLOWING TABLE THAT LISTS THE LENGTH (IN FEET) FOR EACH SIZE/TYPE FITTING WITHIN WHICH ALL JOINTS JUST BE RESTRAINED. ALL FITTINGS AND JOINT RESTRAINTS SHALL BE INSTALLED PER MANUFACTURERS RECOMMENDATIONS & SPECIFICATIONS.

AS AN EXAMPLE, IF YOU ARE INSTALLING A 3" MAINLINE WITH A DIRECTIONAL CHANGE OF 90°, REFER TO CHART UNDER PIPE SIZE TO 3" AND UNDER BENDS 90 YOU WILL SEE THE DISTANCE OF 11'. IF THERE IS ANY JOINT (VALVE, BELL, ETC.) YOU MUST INSTALL A JOINT RESTRAINT WITHIN 11' OF THE 90° MAINLINE DIRECTIONAL CHANGE.

PIPE SIZE	BENDS				REDUCERS			DEAD END	
	11°	22°	45°	90°	1 STEP	2 STEP	3 STEP	BLIND	SERV. B.

INSTALLATION CHART

REFER TO THE FOLLOWING TABLE WHICH LISTS THE NUMBER OF BOLTS, SIZE, AND TORQUE FOR EACH BOLT IN REFERENCE TO THE SIZE OF PIPE WHICH IS BEING RESTRAINED.

AS AN EXAMPLE, IF YOU HAVE A 3" PIPE, YOU WILL NEED 2 BOLTS THAT ARE 3/8 X 2.5" AND TIGHTEN THEM WITH A TORQUE WRENCH TO 20 FT-LBS.

PIPE SIZE	NO. BOLTS	BOLT SIZE	TORQUE FT-LBS.
2"	2	3/8" x 2.5"	20

IRRIGATION NOTES

1. SYSTEM DESIGN BASED ON THE ASSUMPTION OF THE AVAILABILITY OF 78 120 G.P.M WITH 78 P.S.I. AT THE SOURCE. CONTRACTOR TO FIELD VERIFY PRESSURE AND VOLUME AVAILABILITY ON SITE. IF THE SOURCE PRESSURE DOES NOT MEET THESE REQUIREMENTS CONTACT THE LANDSCAPE ARCHITECT IMMEDIATELY FOR CHANGE ORDER REQUIREMENTS.
2. ALL LATERAL LINES THAT ARE NOT LABELED SHALL BE 3/4" DIAMETER.
3. CONTRACTOR TO VERIFY LOCATION OF ALL UTILITIES PRIOR TO INITIATION OF ANY DEMOLITION OR CONSTRUCTION OPERATIONS. ANY DAMAGE TO EXISTING UTILITIES SHALL BE CONTRACTOR'S RESPONSIBILITY.
4. COORDINATE ALL IRRIGATION INSTALLATION OPERATIONS WITH CIVIL, MECHANICAL, AND ELECTRICAL ENGINEERING SHEETS.
5. CONTRACTOR SHALL COORDINATE INSTALLATION OF IRRIGATION CONDUIT AND SLEEVES UNDER HARD SURFACES WITH RESPECTIVE CONTRACTORS.
6. ALL SLEEVES SHALL BE INSTALLED AS PART OF IRRIGATION CONTRACT. APPROXIMATE LOCATION OF SLEEVES ARE SHOWN ON THE IRRIGATION PLAN. FIELD VERIFY LOCATION. ALL ENDS OF SLEEVES SHALL BE TAPED OR CAPPED AND MARKED WITH A 2"X 4" PAINTED STAKE EXTENDING TO 24" ABOVE GRADE. STAKES SHALL NOT BE REMOVED UNTIL THE IRRIGATION SYSTEM IS COMPLETE. ALL SLEEVES SHALL EXTEND A MINIMUM OF 18" BEYOND BACK OF CURB OR EDGE OF PAVEMENT. PROVIDE COMPACTED BACKFILL AS NECESSARY AT HARD SURFACE LOCATIONS.

24. IN THE EVENT OF A DISCREPANCY, IMMEDIATELY NOTIFY THE LANDSCAPE ARCHITECT.
25. IRRIGATION DESIGN IS FOR SCHEMATIC USE ONLY, ALL VALVES AND BOXES ARE TO BE INSTALLED WITHIN PLANTER BEDS

CAUTION NOTICE

THE CONTRACTOR IS SPECIFICALLY CAUTIONED THAT THE LOCATION AND/OR ELEVATION OF EXISTING UTILITIES AS SHOWN ON THESE PLANS IS BASED ON RECORDS OF THE VARIOUS UTILITY COMPANIES AND, WHERE POSSIBLE, MEASUREMENTS TAKEN IN THE FIELD. THE INFORMATION IS NOT TO BE RELIED ON AS BEING EXACT OR COMPLETE. THE CONTRACTOR MUST CALL THE LOCAL UTILITY LOCATION CENTER AT LEAST 48 HOURS BEFORE ANY EXCAVATION TO REQUEST EXACT FIELD LOCATIONS OF THE UTILITIES. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO RELOCATE ALL EXISTING UTILITIES WHICH CONFLICT WITH THE PROPOSED IMPROVEMENTS SHOWN ON THE PLANS.

PRESSURE IRRIGATION SYSTEM NON-POTABLE WATER NOTES

1. ALL VALVE BOXES, QUICK COUPLER VALVES, SPRINKLER HEAD COVERS, AND AUTOMATIC CONTROL VALVES SHALL BE PURPLE TINTED IDENTIFICATION MATERIAL, MARKED WITH "DO NOT DRINK" WARNING.
2. INSTALL FINDER TAPE OVER ALL IRRIGATION MAINS. TAPE SHALL BE 2" WIDE, METALLIC RED IN COLOR, WITH THE WORDS "DANGER - UNSAFE WATER" OR "NON-POTABLE WATER" CLEARLY MARKED ALONG THE LENGTH OF THE TAPE. TAPE SHALL BE PLACED BETWEEN SIX INCHES (6") AND EIGHTEEN INCHES (18") BELOW THE SURFACE, DIRECTLY ABOVE THE TOP OF THE PIPE.

NOTE:
1. GROUNDING ROD PATTERN MAY BE USED WITH BL-LA01 BASELINE LIGHTNING ARRESTOR IN FIELD WIRING
2. GROUND RODS SHALL HAVE A MIN. DIA. OF 5/8" AND A LENGTH OF 10'. THE COPPER GROUNDING PLATES SHALL BE MADE ACCORDING TO THE MINIMUM REQUIREMENTS OF SECTION 250 OF THE NEC THEY ARE TO BE MADE OF COPPER ALLOY INTENDED FOR THE APPLICATION. THE WIRE IS TO BE CONNECTED TO AND THROUGH THE TOP OF THE GROUND ROD USING A CADWELD GT1161G "ONE-SHOT" WELDING KIT. DIFFERENT SOILS PRODUCE DIFFERENT RESISTENCE. THE EARTH-TO-GROUND RESISTANCE OF THIS CIRCUIT SHALL BE MEASURED USING A MEGGER OR OTHER SIMILAR INSTRUMENT, THE CRITICAL ELEMENT IS TO ACHIEVE 10 OHMS RESISTANCE AS A LOW CONDITION IF THE RESISTANCE IS MORE THAN 5 OHMS, THEN ADDITIONAL POWERSET SHALL BE INSTALLED IN THE DIRECTION OF THE IRRIGATION AREA. TO PREVENT THE ELECTRODE-DISCHARGED ENERGY FROM RE-ENTERING THE UNDERGROUND WIRES AND CABLES, ALL ELECTRODES SHALL BE INSTALLED AWAY FROM SAID WIRES AND CABLES. THE SPACING BETWEEN ANY TWO ELECTRODES SHALL BE 16 TO 20 FEET SO THAT THEY DON'T COMPETE FOR THE SAME SOIL. ALL GROUND CIRCUIT CONNECTIONS SHALL BE MADE USING AN EXOTHERMIC WELDING PROCESS BY UTILIZING PRODUCTS SUCH AS THE CADWELD "ONE-SHOT" KITS. SOLDER SHALL NOT BE ALLOWED TO MAKE CONNECTIONS. THE WIRES ARE TO BE INSTALLED IN AS STRAIGHT OF A LINE AS POSSIBLE, AND IF IT IS NECESSARY TO MAKE A TURN OR A BEND IT SHALL BE DONE IN A SWEEPING CURVE RATHER THAN A SHARP BEND. MECHANICAL CLAMPS SHALL BE PERMITTED TEMPORARILY DURING THE RESISTANCE TEST PROCESS, BUT SHALL BE REPLACED WITH CADWELD "ONE-SHOT" KITS IMMEDIATELY THEREAFTER. IT IS RECOMMENDED THAT THE SOIL SURROUNDING ALL THE COPPER ELECTRODES BE KEPT AT A MINIMUM MOISTURE LEVEL OF 15%. THE USE OF SALTS, FERTILIZERS, AND OTHER CHEMICALS SHALL NOT BE ALLOWED IN AN EFFORT TO IMPROVE SOIL CONDUCTIVITY BECAUSE THESE MATERIALS ARE CORROSIVE AND WILL CAUSE THE COPPER ELECTRODES TO BECOME INEFFECTIVE.

REFLECTED CEILING PLAN - DETAILS

GENERAL STRUCTURAL NOTES

GENERAL

1. The structural notes are intended to complement the project specifications. Specific notes and details in the drawings shall govern over the structural notes and typical details.

2. Typical details and sections shall apply where specific details are not shown.

3. The structural drawings are not all-inclusive and do not contain all dimensions, elevations, openings, mechanical shafts, and penetrations needed to build the structure. The contractor shall coordinate these items with the Architectural, Mechanical and Electrical drawings.

4. The contractor shall verify all site conditions and dimensions. If actual conditions differ from those shown in the contract drawings, the contractor shall immediately notify the architect/engineer before proceeding with the fabrication or construction of any affected elements.

5. Omissions or conflicts between the contract drawings and/or specifications shall be brought to the attention of the architect/engineer before proceeding with any work involved. In case of conflict, follow the most stringent requirement as directed by the architect/engineer at no additional cost to the owner.

6. The contractor shall submit a written request to the architect/engineer before proceeding with any changes, substitutions, or modifications. Any work done by the contractor before receiving written approval will be at the contractor's risk.

7. The contractor shall coordinate with all trades any items that are to be integrated into the structural system such as openings, penetrations, mechanical and electrical equipment, etc. Sizes and locations of mechanical and other equipment that differs from those shown on the contract drawings shall be reported to the architect/engineer.

8. The contractor shall provide adequate shoring and bracing as required for the chosen method of erection. Shoring and bracing shall remain in place until final connections for the permanent members are completed. The building shall not be considered stable until all connections are completed. Walls shall not be considered self-supporting and shall be braced until the roof system is completed.

9. The contractor shall not cut or core any holes in masonry or concrete walls without prior review by the architect/engineer.

10. Site observations by BHB Consulting Engineers' field representative shall not be construed as approval of construction procedures nor special inspection.

11. Detailing and shop drawing production for structural elements will require information (including dimensions) contained in the architectural, structural and/or other consultants' drawings. The structural drawings shall be used in conjunction with the architectural and other consultant's drawings. Some dimensions and elements such as elevations, depressions, slopes, mechanical housekeeping pads, etc. are not shown in the structural drawings. All dimensions shown on structural drawings shall be verified by contractor with architectural, mechanical, and electrical drawings.

12. Contractor shall review shop drawings for compliance with contract documents, and stamp shop drawings with review stamp prior to submission to architect for review. Review of shop drawings by BHB Consulting Engineers is for general compliance only and is not intended for approval. The shop drawing review shall not relieve the contractor from the responsibility of completing the project according to the contract documents. Fabrication shall not begin until shop drawings review process is complete. Shop drawings made from reproductions of the contract drawings will be rejected unless the contractor signs a release agreement prior to the shop drawings being reviewed.

13. Only an authorized representative of BHB Consulting Engineers may make changes to these contract drawings. BHB Consulting Engineers shall not be held responsible or liable for any claims arising directly or indirectly from changes made without written authorization by an authorized representative of BHB Consulting Engineers.

14. Bidding, pricing or construction done prior to receiving final building permits from the authorities having jurisdiction is at the contractor's own risk. Changes to the drawings may be required as part of the plan check process. BHB Consulting Engineers will not be held liable for, nor compensate for, changes to these drawings before final jurisdiction approval is obtained.

For early entry saw cutting, joints should be cut within the first 1 to 4 hours (depending on weather conditions and concrete hydration rate; 1 hour for hot weather and 4 hours for cold weather). Where saw cut joints cannot be cut along the entire projected length of the joint, a 90-degree hand grinder or other tool shall be used to complete the joint. Control joints may be installed by:
      i. Saw cut a depth of 1/4 the thickness of the slab (1.1/4" ± for early entry saws) minimum.

GENERAL STRUCTURAL NOTES

9. Construction
   a. Use chairs or other support devices recommended by the CRSI to support and tie reinforcement bars prior to placing concrete. Reinforcing steel for slabs on grade shall be adequately supported. Support reinforcing steel of slabs on grade with precast concrete units. Lifting the reinforcing off the grade during placement of concrete is not permitted.
   b. Concrete to be mechanically consolidated during placement per ACI standards.
   c. Contractor shall coordinate placement of all openings, curbs, dowels, sleeves, conduits, bolts, inserts and other embedded items prior to concrete placement.
   d. All embeds, anchors and dowels shall be securely tied to formwork or to adjacent reinforcing prior to the placement of concrete.
   e. No pipes, ducts, sleeves, etc shall be placed in structural concrete unless specifically detailed or approved by the structural engineer. Penetrations through walls when approved shall be built into the wall prior to concrete placement. Penetrations will not be allowed in footings or grade beams unless detailed. Piping shall be routed around footings and grade beams and unless detailed. Footings shall be stepped to avoid piping.
   f. Reinforcing Bars shall not be welded. Do not substitute reinforcing bars for DBAs or HSAs.

POST-INSTALLED ANCHORS

1. General Post-Installed Anchor Notes
   a. Do not install adhesive anchors in concrete if less than 21 days old; do not install mechanical anchors, screw anchor or powder actuated anchors in concrete less than 7 days old. Contractor must obtain written approval from the engineer to install prior to these time periods. Do not apply full load to anchors until concrete has reached 28-day compression strength.
   b. Anchors or adhesives specified in details shall be provided; alternative anchors or adhesives may be used if the contractor provides calculations demonstrating that the alternative can achieve the performance values of the specified product. These calculations, along with an ICC-ES ESR or IAPMO-UES ER approval for use in cracked concrete and compliant with the specified codes herein, must be submitted to the structural engineer prior to use.
   c. Follow all the manufacturer's recommendations and certification testing reports for anchor installation. See specific anchors below for more information.
   d. No anchor shall be installed within 1.5 anchor rod diameters of an abandoned hole that has been filled with non-shrink grout; increase distance to 3 anchor rod diameters when the abandoned hole has not been filled.

2. Adhesive Anchors
   a. For anchors in concrete, the adhesives shall be divided into two groups: Standard Adhesives and High Strength Adhesives. Standard adhesives can be used in general applications when details reference the "Standard Adhesive Embedment Schedule" on sheet S6.01. High Strength adhesive groups will be specified for the particular application in the drawings and details. Introduction

The purpose of the following study was to determine if the proposed building design for the Jerome Elementary School building meets or exceeds 2018 IEEC code requirements for a commercial building. Using the performance-based compliance method it was determined that the building exceeds code requirements by **38.6%** in energy savings and **37.2%** in cost savings. This report serves as a substitute for the mechanical, electrical, and envelope Comcheck.

Code Baseline Model

The baseline building was built using eQUEST (v3.65), a full building annual simulation program. The 2018 International Energy Conservation Code (IECC) Section C407 was used to build the baseline model using code inputs. Water-source heat pumps at each zone were used as the baseline HVAC system type. Each system includes a supply fan, heat pump coil, space thermostat, and isolation valve. The plant system contains two equally sized gas-fired natural draft boilers, a closed-circuit evaporative fluid cooler with a two-speed fan, and a variable speed loop pump. Table-1 shows the inputs used in the baseline model for envelope, lighting, HVAC, and the domestic hot water heaters. Figure-1 illustrates a screenshot of the energy model rendering.

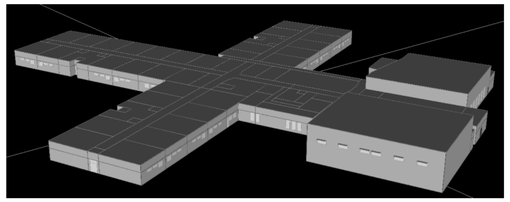

Figure 1 – Building Energy Model Screenshot

Proposed Model

The proposed building includes ground water-source heat pumps for the majority of the zones. A ground loop heat exchanger is used to provide heat and reject heat. Variable primary and secondary pumps are used for water distribution. The gymnasium and cafetorium utilize high-efficient packaged rooftop units. All rooftop units include economizers for free cooling, a supply fan, a return fan, a carbon dioxide sensor for demand-controlled ventilation, an electric direct expansion cooling coil, and a gas-fired heating coil. Electric and gas-fired water heaters are used for the domestic hot water system. The server rooms include high-efficient ductless split systems with remote condensing units. The building also includes a complete digital control system associated with the HVAC and lighting systems. The proposed energy model demonstrated energy and cost savings of **38.6%** and **37.2%,** respectively. The commercial rates from Idaho Power and Intermountain Gas utility companies were used to model the electricity & natural gas tariff. Figure-2, seen below, compares the annual energy consumption breakdown for each model. Figure-3, seen below, outlines the comparison between operational costs for each model.

Summary

The proposed building meets and exceeds IECC 2015 by **38.6%** energy savings and **37.2%** cost savings. See the attached files for reports from eQUEST for inputs.

3. WHEN THE CAPACITY OF THE LAG PUMP IS REDUCED TO 35% (ADJUSTABLE), THE DDC CONTROLLER SHALL STAGE BACK DOWN TO THE LEAD SECONDARY HEATING WATER PUMP IN REVERSE ORDER FROM THE STEPS NOTED ABOVE.
4. EACH PUMP SHALL OPERATE FOR A MINIMUM OF 10 CONSECUTIVE MINUTES (ADJUSTABLE) AND WHEN DISABLED, SHALL REMAIN OFF FOR A MINIMUM OF 5 CONSECUTIVE MINUTES (ADJUSTABLE) BEFORE RESTARTING TO PREVENT SHORT-CYCLING EXCEPT WHEN MANUALLY ENABLED/DISABLED OR BY THE OCCUPIED/UNOCCUPIED SYSTEM SCHEDULE.

THE TWO SECONDARY PUMPS SHALL CYCLE WEEKLY TO MAINTAIN SIMILAR RUNTIMES.

WELL LOOP OPERATION :
THE WELL LOOP PUMPS SHALL OPERATE WHENEVER THE FOLLOWING CONDITION EXISTS:

1. THE CONDENSER LOOP SUPPLY TEMPERATURE INCREASES ABOVE 85°F (ADJUSTABLE).
2. THE CONDENSER LOOP SUPPLY TEMPERATURE DECREASES BELOW 42°F (ADJUSTABLE).

WHEN THE ABOVE CONDITION EXISTS, THE WELL DDC CONTROLLER SHALL SEQUENCE THE FOLLOWING:

1. SEND AN ENABLE COMMAND TO THE LEAD WELL WATER PUMP.
   a. VALIDATE THE RUNNING STATUS THROUGH THE VFD CONTROL INTERFACE.
      1) IF THE LEAD PUMP FAILS TO START, THE STANDBY WELL WATER PUMP SHALL BE ENABLED. AN ALARM OF THE EVENT SHALL BE SENT TO THE OPERATOR'S WORKSTATION.
      2) IF THE STANDBY PUMP FAILS TO START, AN ALARM OF THE EVENT SHALL BE SENT TO THE OPERATOR'S WORKSTATION.

THE WELL LOOP PUMPS SHALL NOT OPERATE WHEN THE CONDENSER WATER LOOP SUPPLY TEMPERATURE IS BETWEEN 42°F AND 85°F (ADJUSTABLE).

BACKUP HEATING MODE OF OPERATION :
THE BACKUP HEATING MODE OF OPERATION SHALL BE ENABLED WHENEVER THE FOLLOWING CONDITION EXISTS:

1. THE CONDENSER LOOP SUPPLY TEMPERATURE FALLS BELOW 42°F (ADJUSTABLE) FOR A PERIOD OF 5 MINUTES (ADJUSTABLE).

WHEN THE ABOVE CONDITION EXISTS, THE BOILER CONTROLLERS SHALL SEQUENCE THE FOLLOWING:

1. SEND AN ENABLE COMMAND TO THE LEAD BOILER (B-1) UNIT CONTROL PANEL (UCP).
   a. VALIDATE THE RUNNING STATUS OF THE BOILER THROUGH THE UNIT CONTROL PANEL (UCP).
      1) IF THE LEAD BOILER FAILS TO START, THE LAG BOILER (B-2) SHALL BE ENABLED.
      2) IF BOTH BOILERS FAIL TO START, AN ALARM OF THE EVENT SHALL BE SENT TO THE OPERATOR'S WORKSTATION.
2. THE BOILER UNIT CONTROL PANEL (UCP) SHALL ENABLE AND MODULATE THE RESPECTIVE BOILER PUMP. THE BOILER UNIT CONTROL PANEL (UCP) SHALL VERIFY FLOW THROUGH A FLOW SWITCH.
3. WHEN A RUNNING STATUS FROM THE UNIT CONTROL PANEL (UCP) HAS BEEN CONFIRMED, THE BOILER SYSTEM SHALL CONTINUE TO OPERATE UNDER ITS OWN INTERNAL CONTROLS BY ENABLING AND MODULATING THE NECESSARY BOILERS. THE DIGITAL CONTROLLER SHALL SEND THE UNIT CONTROL PANEL (UCP) A CONDENSER WATER SUPPLY TEMPERATURE SETPOINT TO MAINTAIN.
4. THE BOILER MANUFACTURER SHALL PROVIDE A FIELD INSTALLED 2-WAY MOTORIZED CONTROL VALVE TO MODULATE OPEN AND CLOSED BASED ON THE BOILER SUPPLY AND RETURN WATER TEMPERATURES. THE CONTROL OF THE VALVE IS HANDLED THROUGH THE BOILER UNIT CONTROL PANEL (UCP).

THE LEAD BOILER SHALL CYCLE TO MAINTAIN SIMILAR RUNTIMES.

THE HEATING SYSTEM SHALL BE DISABLED WHEN THE FOLLOWING CONDITION EXISTS:

1. THE CONDENSER LOOP SUPPLY TEMPERATURE RISES ABOVE 42°F (ADJUSTABLE) FOR A PERIOD OF 15 MINUTES (ADJUSTABLE).

WHEN ONE OF THE ABOVE CONDITIONS ARE MET, THE DDC CONTROLLER SHALL SEQUENCE THE FOLLOWING:

1. SEND A DISABLE COMMAND TO THE LEAD BOILER'S UNIT CONTROLLER.
   a. VALIDATE THE RUNNING STATUS OF THE BOILER THROUGH THE UNIT CONTROL PANEL (UCP).
      1) IF THE LEAD BOILER FAILS TO STOP, AN ALARM OF THE EVENT SHALL BE SENT TO THE OPERATOR'S WORKSTATION.

WHEN THE HEATING WATER SYSTEM IS DISABLED, THE LEAD SECONDARY HEATING WATER PUMP SHALL CONTINUE TO OPERATE FOR A PERIOD OF 10 CONSECUTIVE MINUTES (ADJUSTABLE).

CONDENSER LOOP BYPASS CONTROL VALVE:
THE BYPASS CONTROL VALVE (BCV-2) SHALL BE ENABLED WHENEVER THE FOLLOWING CONDITION EXISTS:

1. THE DIFFERENTIAL PRESSURE INCREASES TO THE MAXIMUM DIFFERENTIAL PRESSURE SETPOINT FOR A PERIOD OF 10 CONSECUTIVE MINUTES (ADJUSTABLE).

WHEN THE ABOVE CONDITION IS MET, THE DDC CONTROLLER SHALL SEQUENCE THE FOLLOWING:

1. MODULATE THE VALVE TO MAINTAIN THE MAXIMUM DIFFERENTIAL SETPOINT.

THE MAXIMUM DIFFERENTIAL PRESSURE SETPOINT SHALL BE SET AT 5 PSIG (ADJUSTABLE) ABOVE THE DIFFERENTIAL PRESSURE SETPOINT.

VFD POINTS LIST:
THE VFD CONTROL INTERFACE SHALL PROVIDE THE FOLLOWING BUT NOT LIMITED TO:
2. ENABLE/DISABLE
3. ALARMS
4. HERTZ
5. SPEED CONTROL

SAFETIES:
A DIFFERENTIAL PRESSURE SENSOR SHALL MONITOR THE PRESSURE ACROSS THE WELL SIDE OF THE HEAT EXCHANGER AND ALARM THE OPERATOR WORKSTATION IF THE PRESSURE DIFFERENCE IS GREATER THAN 8 PSI.
